What we claim is:

A printed circuit board design system for generating a 3D model 1. of a printed circuit board which mounts a component on a printed board and for performing, with a three-dimensional CAD system, a mounting design including a cabinet comprising:

a converter for converting the printed circuit board into one or more models based on attributes preliminarily added to the component.

- The printed circuit board design system as claimed in claim 1 2. wherein when the attribute is a mounting side, the converter converts the printed board and a component mounted on an L1 side into an L1 side portion model, and converts the printed board and a component mounted on an Ln side into an Ln side portion model.
- The printed circuit board design system as claimed in claim 1 3. wherein when the attribute is at least one of an arrangement and a fixation, the converter converts the component which is not arranged on the printed circuit board into an unarranged component model, and converts the component which is not fixed into a nonfixed component model.
- The printed circuit board design system as claimed in claim 1 4. wherein the converter converts the printed board and the component into a library model related to the attribute.
- The printed circuit board design system as claimed in claim 1 5. wherein the converter converts the component into either a pseudo shape model or a detailed shape model.
